Macintosh Proxy Settings
OSX 10.6 – 10.8

Body

1. Open your System preferences and select the Network preference pane.

2. Select Wi-Fi or Ethernet depending on what network you will be using. You can set this on both if you wish. It will not affect off campus use. Press the advanced button at the bottoms right once you select your network.
3. Select the Proxies tab at top. Place a check mark in the very top option. It will be called “Auto Proxy Discovery”. This is the only item that needs to be checked. Press OK and then press apply. You may now close your system preferences. This will set the proxy for the system and Safari. If you use Firefox, you may need to set its preferences as well. Below are the Firefox settings.

1. Open Firefox, and pull down the menu. Select Preferences.

2. Select the Advanced tab on the right and then the Network tab in the middle. Once there, press the Settings button under the Connection heading.
3. Make sure there is a selection ball next to “Auto-Detect Proxy settings for this network” and then hit the OK button. You can now back out of the settings and Firefox is now set. Once again, this setting will not affect your connection ability while off campus.
